

# Breaking the Orthogonality Barrier: Large-Girth Regular LDPC Structures with Favorable Distance for Quantum Error Correction

Kenta Kasai

Institute of Science Tokyo

ITA 2026, Bahia Resort Hotel, San Diego, Feb 8–13, 2026

Based on [arXiv:2601.08824](https://arxiv.org/abs/2601.08824)

# Motivation: Classical vs Quantum LDPC

**Classical:** sparse+random+large girth  $\Rightarrow$  strong BP, large distance.

**Quantum:** CSS constraint  $H_X H'_Z = 0$  couples  $H_X, H_Z$ .

**Issue:** naive orthogonality  $\Rightarrow$  short cycles, small distance.

**Goal:** keep classical structure *without* the orthogonality distance penalty.

# Problem:

## Parent construction

$$\hat{H}_X = \begin{bmatrix} H_X \\ \tilde{H}_X \end{bmatrix}, \quad \hat{H}_Z = \begin{bmatrix} H_Z \\ \tilde{H}_Z \end{bmatrix}, \quad \hat{H}_X(\hat{H}_Z)' = 0$$

- Full orthogonality forces  $H_X(\tilde{H}_Z)' = 0$ ,  $H_Z(\tilde{H}_X)' = 0$ .
- Removed rows  $\tilde{H}_X, \tilde{H}_Z$  become logicals.
- $d_{\min} \leq$  row weight.

# Design Principle

- Active orthogonality only:  $H_X H_Z' = 0$ .
- Latent blocks non-orthogonal:  $H_X(\tilde{H}_Z)' \neq 0$ ,  $H_Z(\tilde{H}_X)' \neq 0$ .
- Latent distances:  $d_X^{(\text{lat})}$ ,  $d_Z^{(\text{lat})}$ .

## Latent-based distances

$$d_X^{(\text{lat})} := \min\{(C_Z \cap \text{Row}(\tilde{H}_X)) \setminus C_X^\perp\},$$
$$d_Z^{(\text{lat})} := \min\{(C_X \cap \text{Row}(\tilde{H}_Z)) \setminus C_Z^\perp\}.$$

# Code Construction

**Example**  $J = 3, L = 12$ .

$$\hat{H}_X = \left( \begin{array}{cccccc|cccccc} F_0 & F_1 & F_2 & F_3 & F_4 & F_5 & G_0 & G_1 & G_2 & G_3 & G_4 & G_5 \\ F_5 & F_0 & F_1 & F_2 & F_3 & F_4 & G_5 & G_0 & G_1 & G_2 & G_3 & G_4 \\ F_4 & F_5 & F_0 & F_1 & F_2 & F_3 & G_4 & G_5 & G_0 & G_1 & G_2 & G_3 \\ F_3 & F_4 & F_5 & F_0 & F_1 & F_2 & G_3 & G_4 & G_5 & G_0 & G_1 & G_2 \\ F_2 & F_3 & F_4 & F_5 & F_0 & F_1 & G_2 & G_3 & G_4 & G_5 & G_0 & G_1 \\ F_1 & F_2 & F_3 & F_4 & F_5 & F_0 & G_1 & G_2 & G_3 & G_4 & G_5 & G_0 \end{array} \right),$$

$$\hat{H}_Z = \left( \begin{array}{cccccc|cccccc} G'_0 & G'_5 & G'_4 & G'_3 & G'_2 & G'_1 & F'_0 & F'_5 & F'_4 & F'_3 & F'_2 & F'_1 \\ G'_1 & G'_0 & G'_5 & G'_4 & G'_3 & G'_2 & F'_1 & F'_0 & F'_5 & F'_4 & F'_3 & F'_2 \\ G'_2 & G'_1 & G'_0 & G'_5 & G'_4 & G'_3 & F'_2 & F'_1 & F'_0 & F'_5 & F'_4 & F'_3 \\ G'_3 & G'_2 & G'_1 & G'_0 & G'_5 & G'_4 & F'_3 & F'_2 & F'_1 & F'_0 & F'_5 & F'_4 \\ G'_4 & G'_3 & G'_2 & G'_1 & G'_0 & G'_5 & F'_4 & F'_3 & F'_2 & F'_1 & F'_0 & F'_5 \\ G'_5 & G'_4 & G'_3 & G'_2 & G'_1 & G'_0 & F'_5 & F'_4 & F'_3 & F'_2 & F'_1 & F'_0 \end{array} \right),$$

$$\hat{H}_X(\hat{H}_Z)' = \left( \begin{array}{ccc|ccc} \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 \\ \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 \\ \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 \\ \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 \\ \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 \\ \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 \end{array} \right),$$

$$\Psi_r := \sum_{u=0}^{L/2-1} (F_u G_{r-u} + G_{r-u} F_u), \quad r \in [L/2].$$

# Code Construction (Cont.)

**Example**  $J = 3, L = 12$ .

$$\hat{H}_X(\hat{H}_Z)' = \left( \begin{array}{ccc|ccc} \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 \\ \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 \\ \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 & \Psi_3 \\ \hline \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 & \Psi_2 \\ \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 & \Psi_1 \\ \Psi_1 & \Psi_2 & \Psi_3 & \Psi_4 & \Psi_5 & \Psi_0 \end{array} \right)$$

$\Gamma$	$G_0$	$G_1$	$G_2$	$G_3$	$G_4$	$G_5$
$F_0$	C	C	C		C	C
$F_1$	C	C		C	C	C
$F_2$	C		C	C	C	C
$F_3$		C	C	C	C	C
$F_4$	C	C	C	C	C	
$F_5$	C	C	C	C		C

# Code Construction (Cont.)

## Required constraints on $F_i, G_j$ :

- Commute on  $\Gamma$
- Avoid short cycles
- Full search is combinatorial.

## Search strategy:

- Restrict to affine permutations on  $\mathbb{Z}_P$ .
- Checks are  $P$ -independent.
- Sequential construction is fast<sup>1</sup>.

<sup>1</sup>[github.com/kasaikenta/construct\\_apm\\_css\\_code](https://github.com/kasaikenta/construct_apm_css_code)

# Constructed Code Example

- Girth-8 (3, 12)-regular  $[[9216, 4612, \leq 48]]$  with  $P = 768$ .
- Explicit weight-48 logicals  $\Rightarrow d_{\min} \leq 48$ .
- $d_X^{(\text{lat})} = d_Z^{(\text{lat})} = 48$  (proof omitted).
- No logical failures observed  $\Rightarrow d_{\min}$  likely near 48.

# Decoding Algorithm (BP + Post-Processing)

1. **Joint BP:** decode on  $H_X, H_Z$  using  $X/Z$  correlations.
2. **Trigger:** if unsatisfied checks are small (e.g.,  $\leq 10$ ), estimate a suspect set  $K$  (OSD + flip-history + ETS library).
3. **PP:** solve the restricted residual and apply only if small-weight.

$$\mathbf{s}_X = (H_Z)_K(\mathbf{x})_K \oplus (H_Z)_{\overline{K}}(\hat{\mathbf{x}})_{\overline{K}}$$

# Performance

- **Code:** girth-8, (3,12)-regular  $[[9216, 4612, \leq 48]]$ .
- **Decoding:** joint BP + PP<sup>a</sup> reaches FER  $10^{-8}$  at  $p = 4\%$ .
- **Benchmark:** BP aligns with DE (cycle-free, random non-orthogonal (3,12) code).

<sup>a</sup>[github.com/kasaikenta/joint\\_BP\\_plus\\_PP](https://github.com/kasaikenta/joint_BP_plus_PP)

# Conclusion

- Active-only orthogonality avoids the distance penalty.
- APMs control commutativity and short cycles.
- Girth-8  $(3, 12)$ -regular  $[[9216, 4612, \leq 48]]$  with strong BP performance.
